

SNIFF Test for AI-generated Content

NOTE: Depending on the info and how you plan to use it, you may not use *all* the SNIFF Test strategies *all* the time. But you should keep these in mind when encountering unfamiliar, or potentially, AI-generated info.

SOURCE CHECK!

Don't rely on a single piece of information from AI. It makes stuff up. Verify the source/claim by looking at trusted, reputable sources like well-known news outlets, academic publications, or official websites.

NAVIGATE to a **NEW TAB**

To evaluate a suspicious source/claim, navigate to a new tab and Google it. Find a source that confirms or refutes it. This strategy of verifying info as you're reading it is called, '[lateral reading](#),' and is critical for evaluating sources online. For images, try a reverse Google image search, or [TinEye](#).

INVESTIGATE CITATIONS

If the AI output provides specific references or citations, look them up yourself to confirm they exist. You can plug the article title with quotes ("") into your library's search engine or Google. If you can't find it quickly, it's likely an [AI hallucination](#). You also want to verify that the citation actually supports the info presented. Just because it's cited, doesn't mean it's accurate.

FACT-CHECK EVERYTHING

Websites like Snopes, FactCheck.org, or PolitiFact can help verify claims that sound suspicious or widely debated on social media. Sometimes AI-generated info mixes up dates, statistics, or names. Double-check such details carefully. When in doubt, ask a human - professor, librarian, or someone who is knowledgeable on the topic.

FIGHT the **URGE to **COPY+PASTE!****

AI tools are known to present people with fictitious information *confidently*. Even if it sounds plausible and you're short on time, don't just copy and paste the information into your work. Use the strategies above to verify the info for accuracy.
